

The hopatch package

Heiko Oberdiek*

2016/05/16 v1.3

Abstract

This packages provides a wrapper to various package hooks provided by other packages or classes, but does not define own hooks.

1 Documentation

Sometimes I want to add code right after a package has been loaded. Examples are bug fixes, adaptations, or added features as needed by package `hyperref`, for instance.

Unhappily `LATEX` does not provide this kind of hook. `\AtEndOfPackage` can be used inside the package only, because `LATEX` clears the hook right before it loads the package.

Table 1: After package hooking

Macro	Provider
<code>\AfterPackage</code>	package scrfile [5]
<code>\AtEndOfPackageFile</code>	package filehook [2]
<code>\AtEndPackage</code>	class memoir [4]

Table 2: After begin document hooking

Macro	Provider
<code>\AtBeginDocument</code>	L ^A T _E X’s kernel
<code>\AtEndPreamble</code>	package etoolbox [1]
<code>\AfterEndPreamble</code>	package etoolbox

However, there are already many packages and classes that provide hooks that are executed after the package is loaded, see table 1.

Package `hopatch` can be used without the packages of table 1. But for an early executing right after a package is loaded, one of the following class or packages should be loaded before using `\hopatch@AfterPackage`:

- package filehook
- package scrfile
- class memoir

Therefore I skip writing a new package for hooking into L^AT_EX’s package management and use this package to provide a wrapper to patch a package after it is loaded.

`\hopatch@AfterPackage {⟨package⟩} {⟨patch code⟩}`

If the package is already loaded, the `⟨patch code⟩` is executed immediately. Otherwise the `⟨patch code⟩` is stored in a command and tried at later locations until the package is available.

The patch is tried in the following order:

1. If the package is already loaded, the patch is applied immediately. Further locations are not tried.
2. `\AtEndPackage`, provided by class memoir [4], and `\AfterPackage`, provided by package scrfile [5], are called right after the package file is input before the hook of L^AT_EX’s `\AtEndOfPackage`.
3. `\AtEndOfPackageFile`, provided by package filehook [2], is called after the package is loaded and after the hook of L^AT_EX’s `\AtEndOfPackage`.
4. `\AtEndPreamble`, provided by package etoolbox [1], is called at the beginning of `\begin{document}` before the hook of L^AT_EX’s `\AtBeginDocument`.
5. `\AtBeginDocument`, provided by L^AT_EX.
6. `\AfterEndDocument`, provided by package etoolbox [1], is called at the very end of `\begin{document}`. Preamble commands are already forbidden there.

*Please report any issues at <https://github.com/ho-tex/oberdiek/issues>

Because of the various locations the patch code is restricted to limitations:

- Preamble commands, see L^AT_EX's `\@onlypreamble` throw an error if used after `\begin{document}`. This is already the case for `\AfterEndDocument`. Therefore preamble commands are forbidden in the patching code. There are four exceptions `\ifpackageloaded`, `\ifclassloaded`, `\ifpackagelater` and `\ifclasslater`. They are redefined during `\AfterEndDocument` using the counterparts of package `ltxcmds` [3].
- `\AfterPackage` of package `scrfile` and `\AtEndPackage` of class `memoir` call the hook before L^AT_EX's `\AtEndOfPackage`.

2 Implementation

```

```

3 Installation

3.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/hopatch.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/hopatch.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for T_EX Files” ([CTAN:pkg/tds](#)). Directories with `texmf` in their name are usually organized this way.

3.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

3.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain T_EX:

```
tex hopatch.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```

hopatch.sty → tex/latex/oberdiek/hopatch.sty
hopatch.pdf → doc/latex/oberdiek/hopatch.pdf
hopatch.dtx → source/latex/oberdiek/hopatch.dtx

```

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

3.4 Refresh file name databases

If your T_EX distribution (T_EX Live, mikT_EX, ...) relies on file name databases, you must refresh these. For example, T_EX Live users run `texhash` or `mktextlsr`.

¹[CTAN:pkg/hopatch](#)

3.5 Some details for the interested

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain T_EX: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{hopatch.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex hopatch.dtx
makeindex -s gind.ist hopatch.idx
pdflatex hopatch.dtx
makeindex -s gind.ist hopatch.idx
pdflatex hopatch.dtx
```

5 History

[2011/01/30 v1.0]

- First public version.

[2011/06/24 v1.1]

- Fix the use of `\AtEndPreamble` and `\AfterEndPreamble`. They are redefined by package `etoolbox` after their hooks are used and generate an error message then.

[2012/05/28 v1.2]

- Fix for use without ε -T_EX (thanks Gordon Lee).

[2016/05/16 v1.3]

- Documentation updates.
